1. Container Lifecycle Management

docker run -it <image>	Create and start a container in interactive mode.
docker ps -a	List all containers (running and stopped).
docker stop <id>	Gracefully stop a running container.
docker rm -f <id>	Forcefully remove a container.
docker exec -it <id> bash	Interview favorite: Open a shell inside a running container.

2. Image Manipulation

docker images	List all locally stored images.
docker build -t <name> .	Build an image from a Dockerfile in the current directory.
docker pull <image>	Download an image from Docker Hub.
docker rmi <id>	Remove a local image.
docker history <id>	Show the layers of an image (great for debugging size).

3. Storage & Networking

docker volume create <name>	Create a persistent storage area.
docker network ls	List all networks (Bridge, Host, None).
docker inspect <id>	Get low-level JSON info (IP address, mount points).
docker run -p 8080:80	Map host port 8080 to container port 80.

4. Maintenance & Cleanup

docker logs -f <id>	Tail the live logs of a container.
docker stats	Display a live stream of resource usage (CPU/Memory).
docker system prune	The "Magic" command. Removes all unused resources
